## 1 Overview

WPay 2D is a credit/debit card payment option processed through a WordPress + WooCommerce site running the **WPay Channels** plugin. The checkout server creates a WooCommerce order via the WC REST API, redirects the customer to that order's pay-for-order page (WPay Channels' own card form, tokenized via Basis Theory — raw card data never touches the checkout server), and WooCommerce fires a webhook back when the order's status changes.

This is a separate integration from `services/wpay.py` (the WPay HPP flow, gated by `WPAY_ENABLED`) — both can be enabled at once.

## 2 Architecture

```

Customer → checkout-server (pepscheckoutportal.com)
  → POST /api/checkout/wpay_2d
  → creates local Order row (payment_method = wpay_2d)
  → creates WooCommerce order via REST API on wpay.pepscheckoutportal.com
  → redirects customer to WC's pay-for-order page
  → customer enters card on WPay Channels' tokenized form
  → WooCommerce fires webhook → POST /webhooks/wpay_2d
  → checkout-server marks local order paid/failed, creates Shopify order,
    fires affiliate webhook

```

No Celery fallback task exists for wpay\_2d yet (unlike the HPP flow's 45-minute poll) — this path currently relies on the webhook firing reliably.

### 3 Infrastructure

| COMPONENT               | VALUE                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------|
| Checkout server host    | dev1@nickcheckout VPS, path /srv/shared/checkout-server                               |
| Checkout server service | checkout.service (single systemd unit — no separate worker/beat units on this box)    |
| Checkout server domain  | https://pepscheckoutportal.com (Cloudflare-proxied)                                   |
| WordPress site path     | /var/www/wordpress-wpay — same VPS                                                    |
| WordPress domain        | https://wpay.pepscheckoutportal.com — real HTTPS via Let's Encrypt                    |
| WordPress DB            | wordpress_wpay (MariaDB)                                                              |
| Active WP theme         | Custom theme " <b>WPay Checkout</b> " — built specifically for this payment-only site |
| Server IP               | 202.181.177.119                                                                       |

## 4 DNS & SSL

| TYPE | NAME | CONTENT         | PROXY                                 |
|------|------|-----------------|---------------------------------------|
| A    | wpay | 202.181.177.119 | <b>DNS only</b> — must stay unproxied |

Cloudflare zone: `pepscheckoutportal.com` . Certificate: Let's Encrypt, auto-renewing, **expires 2026-10-26**. Location on server: `/etc/letsencrypt/live/wpay.pepscheckoutportal.com/` .

## 5 nginx & wp-config.php

Two nginx server blocks exist for the WordPress site:

- **Legacy** — `/etc/nginx/sites-available/wordpress-wpay` , port `8080` , bare IP access. Still present, not removed.
- **Current** — `/etc/nginx/sites-available/wpay-domain` , ports 80/443, real domain, HTTPS auto-configured by certbot.

Both include this required line (nginx doesn't forward the Authorization header to PHP-FPM by default — needed for Application Password auth):

```
fastcgi_param HTTP_AUTHORIZATION $http_authorization;
```

Added to `wp-config.php` :

```
define( 'WP_ENVIRONMENT_TYPE', 'local' );
define( 'WP_HOME', 'https://wpay.pepscheckoutportal.com' );
define( 'WP_SITEURL', 'https://wpay.pepscheckoutportal.com' );
```

`WP_ENVIRONMENT_TYPE=local` was needed to unlock Application Passwords before real HTTPS existed. No longer strictly required now, but harmless to leave.

## 6 Credentials

## WordPress admin login

### WP-ADMIN

|          |                                                  |
|----------|--------------------------------------------------|
| URL      | https://wpay.pepscheckoutportal.com/wp-login.php |
| Username | admin                                            |
| Password | McueXTqFsJEgnqen0c2Y                             |

## WordPress Application Password API only

Not usable on the login form — for REST API auth only. Used by `services/wpay_wp.py` via `ONRAMP_WP_USERNAME` / `ONRAMP_WP_APP_PASSWORD`.

|              |                               |
|--------------|-------------------------------|
| User         | admin                         |
| App password | 3wPy Gm9B h9G5 eu2V WVq9 tv9j |

## WooCommerce REST API keys legacy / fallback

Not the active auth path (app currently uses the Application Password above whenever both username + app password are set).

|              |                                             |
|--------------|---------------------------------------------|
| Key          | ck_7a7191a85b07a9a857ef14c3355a0fea90bcf242 |
| Secret       | cs_ea1305f7ba67ea7c9aec71514b05745feb468acf |
| Spare key    | ck_d793db3a4fbb0c208073e29dd953624af77903f3 |
| Spare secret | cs_a453859719eda7a5d81225ed9606ce61a04c7258 |

The "spare" pair was generated during debugging and isn't referenced anywhere — safe to revoke if cleaning up.

## WooCommerce webhook

|              |                                                 |
|--------------|-------------------------------------------------|
| Name         | WPay 2D → checkout-server                       |
| Topic        | Order updated                                   |
| Delivery URL | https://pepscheckoutportal.com/webhooks/wpay_2d |
| Secret       | PepsCheckoutWooCommerce***                      |

Must match `WPAY_WP_WEBHOOK_SECRET` in `.env` exactly.

## WPay Channels merchant account

the actual processor

|            |                                     |
|------------|-------------------------------------|
| Backoffice | https://backoffice.wpaychannels.com |
| UID        | WpayUID0202                         |
| Password   | WpCrm)(&_ \$0202&                   |

Used in WooCommerce → Settings → Payments → WPay 2D gateway as the **UID** field. The **User token** field was set to this same password as a first attempt — if payments ever fail unexpectedly, log into the backoffice and check for a dedicated API token separate from the login password.

### 7 .env configuration (checkout-server)

```
ONRAMP_WP_ENABLED=false
ONRAMP_WP_URL=https://wpay.pepscheckoutportal.com
ONRAMP_WP_CONSUMER_KEY=ck_7a7191a85b07a9a857ef14c3355a0fea90bcf242
ONRAMP_WP_CONSUMER_SECRET=cs_ea1305f7ba67ea7c9aec71514b05745feb468acf
ONRAMP_WP_USERNAME=admin
ONRAMP_WP_APP_PASSWORD=3wPy Gm9B h9G5 eu2V wVq9 tv9j
WPAY_WP_ENABLED=true
WPAY_WP_WEBHOOK_SECRET=PepsCheckoutWooCommerce***
WPAY_WP_STORES=victoriapeps.ca
```

- `ONRAMP_WP_ENABLED=false` is intentional — the *onramp\_wp* integration itself stays off; only the WPay 2D gateway (which reuses this site's URL/creds) is active.
- `WPAY_WP_STORES` is a comma-separated allowlist of storefronts that see this option. Currently only `victoriapeps.ca`.
- Minimum order: **\$5 USD** ( `services/wpay_wp.py:MIN_AMOUNT` ), enforced server-side.

### 8 Database migration required

```
python -m migrations.add_wpay_2d_to_payment_method_enum
```

Widens the `orders.payment_method` ENUM to accept `'wpay_2d'`. Idempotent. Was missing on this VPS initially — caused a 500 on every checkout attempt until run.

## 9 Frontend styling

Custom theme "WPay Checkout" is active. Additional CSS applied via **Appearance** → **Customize** → **Additional CSS**: centered card layout, styled order table, calmer guest-order notice, wider container (prevents card/expiry/CVC fields from cramping), emphasized Total row, trust signal below the Pay button.

**Known open item:** the "Payment method: Credit / Debit Card" summary row still shows — the CSS selector guess to hide it didn't match this theme's actual markup. Needs the real class (inspect-element) to fix precisely.

## 10 Debugging history (condensed, chronological)

1. Fixed duplicate/conflicting `ONRAMP_WP_URL` blocks in `.env` — one pointed at a dead site.
2. Ran the missing `add_wpay_2d_to_payment_method_enum` migration.
3. Patched `services/wpay_wp.py` to raise a proper error instead of crashing on a non-JSON WooCommerce response.
4. Fixed the WooCommerce webhook secret mismatch.
5. Site was briefly in "Coming Soon" mode — switched to Live.
6. Diagnosed that consumer-key/secret query-string auth doesn't work at all on this site.
7. Fixed nginx to forward the Authorization header to PHP-FPM.
8. Unlocked Application Passwords without real HTTPS via `WP_ENVIRONMENT_TYPE=local`.
9. Generated a real Application Password, confirmed it authenticates.
10. Found the actual root cause of a persistent empty-response bug: `ONRAMP_WP_USERNAME` had silently vanished from `.env`.
11. Confirmed real WooCommerce order creation end-to-end.
12. Found and configured the real WPay merchant credentials, got the live card form rendering.

13. Migrated the WordPress site from bare IP:port to real HTTPS (Cloudflare DNS + certbot).
14. Styled the pay-for-order page (custom theme + Additional CSS).

## 11 Still open / next steps

- ☐ Fix the "Payment method" row CSS selector once its real class is known.
- ☐ Confirm the WPay backoffice User token value is actually correct (vs. reused login password) if a live payment fails.
- ☐ Full real end-to-end test on `victoriapeps.ca` checkout — place order, complete/decline a card payment, confirm webhook + Shopify order + affiliate webhook.
- ☐ Consider cleaning up the legacy `:8080` nginx block and unused WooCommerce REST keys.
- ☐ `ONRAMP_WP_GATEWAY_ID` / `WPAY_WP_PRODUCT_ID` are unset (defaults / fee\_lines) — confirm intentional if a real product catalog is ever wanted.

Local reference document — not published, not synced anywhere.
